

S A F E A N D N A T U R A L

Your nervous system controls and regulates every cell of your body. When your nervous system doesn't work right, you don't work right. And when you don't work right, you're sick! Simple as that.

The tests described on the following pages reveal effects of nervous system compromise.

HEADACHES?

1. With the test subject comfortably seated and their eyes closed, have them tilt their head up and down several times, coming to a neutral resting position.

They have been simplified so you can conduct them at home with a minimal amount of time, equipment and training.

Study the pictures, follow the directions and record your results. If the results indicate that you are a good candidate for chiropractic care, arrange a thorough examination in our office immediately. Neglected, spinal problems worsen and make correction more difficult and expensive later on.

2. With their eyes still closed and without moving their shoulders, have them rotate their head fully to the left and hold for a few seconds.

3. With their eyes still closed and without moving their shoulders, have them rotate their head fully to the right and hold for a few seconds.

Could they turn further in one direction than the other?

Yes **No**

Was there pain associated with turning in either direction?

Did the subject hear any "popping" or grinding sounds?

"Yes" responses are significant and should prompt a more thorough examination in our office.
